

Bash-Debugger sketched documentation

cieplypolar

Note: Sketches have not been updated continuously, keep that in mind ;)

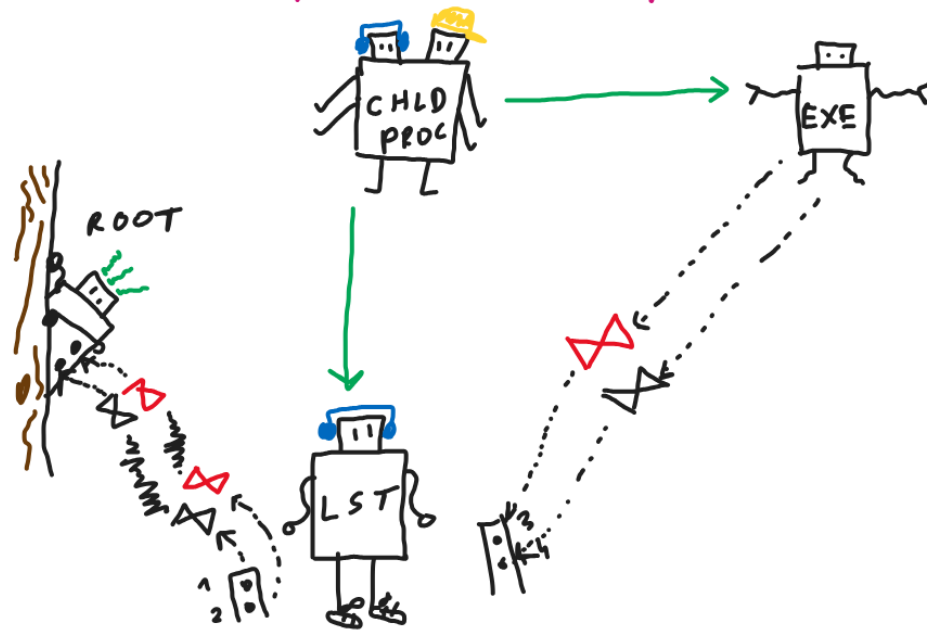

`$DEBUG` - env. var. responsible for only one root execution
sets as first thing to do

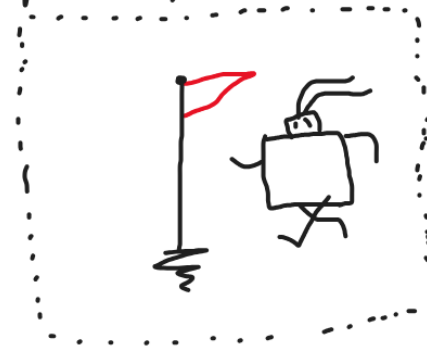

3. ↳ root executes rootProcess
↳ after finish he unsets \$DEBUG
↳ returns exit code

↳ fork child executes childProcess
↳ returns exit code

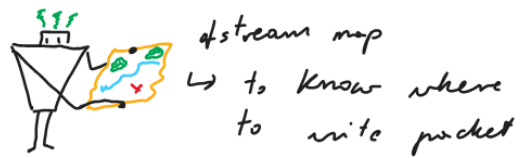

4. child Processes (program_name, args)

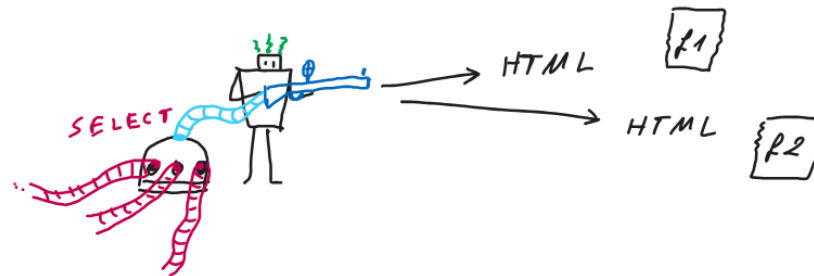

piece of art (not related)

5. root Process

↳ generally root is master of writing
he creates all the files and links

6. packets flow
